Farm Management

Operations, hygiene, and planning

A well-managed mushroom farm relies on repeatable routines: staff understand their tasks, rooms and tools are kept clean, crop conditions are monitored, and records guide production decisions. This guide introduces practical habits for daily operations, hygiene, and planning. Apply its guidance to your species, production system, written farm procedures, and local requirements.

1. Organize work around the crop cycle

Map the stages used on your farm, from culture and substrate preparation through incubation, growing, harvesting, packing, and room turnaround. Separate areas or work periods where possible so clean work is protected from dirty returns and waste. Assign responsibility for each stage and for handing a batch to the next stage.

- Use batch IDs that follow each crop through rooms, harvest, packing, and sales records.
- Schedule work in a consistent order. Protect clean inoculation or spawning work with clean equipment and controlled staff movement.
- Post room assignments and current batch status where staff can check them.
- Use a handover log for incomplete tasks, room faults, crop concerns, and follow-up actions.

2. Set roles and communicate daily

At the start of each work period, confirm priorities, staffing, room assignments, protective clothing, and known hazards. Workers should know who can approve room-setting changes, batch movements, room release after cleaning, and product holds.

- Give each task an owner and a clear completion check.
- Train staff before they operate equipment, handle cultures, mix chemicals, or enter restricted areas.
- Report injuries, equipment problems, contamination concerns, pest activity, and food safety issues promptly.
- Keep instructions brief and accessible in a format workers understand.

3. Keep hygiene practical and consistent

Hygiene protects crop performance and food safety. First remove substrate, soil, and other organic matter; then apply a sanitizer or disinfectant suitable for the intended use. Follow the product label for concentration, contact time, rinsing, ventilation, and protective equipment. Product approvals differ by country and by whether a surface contacts food.

- Separate clean and dirty tools, clothing, containers, and routes. Clean and release dirty equipment before returning it to a clean area.
- Wash hands at appropriate points, including before handling clean materials and after waste or crop-removal tasks. Keep food and personal items out of production and packing areas.
- Use potable water where it may contact mushrooms, food-contact surfaces, or materials that contact them. Prevent standing water and repair leaks.
- Maintain doors, screens, drains, and waste areas to reduce pest entry and harbourage.
- Use a written cleaning schedule that records the area, method, product, responsible person, and completion.

4. Monitor rooms and crops

Room conditions must follow the approved procedure for the species, strain, and crop stage. Check and record the farm's chosen parameters at defined times. Use maintained instruments and respond to readings outside farm action limits. Do not copy settings from a different crop or production system.

- Record room, date and time, batch, readings, staff initials, and corrective action.
- Observe crop development as well as instrument readings. Note uneven growth, unusual colour or odour, excess condensation, drying, pests, or suspected contamination.
- Escalate out-of-limit readings and observations; record the decision and who authorized it.
- Maintain calibration, maintenance, and repair records for environmental controls.

5. Plan production and supplies

Work backward from expected customer demand and harvest dates. Keep a rolling schedule of batches, room use, key task dates, expected harvest windows, labour needs, and delivery commitments. Crop timing and yield vary, so update forecasts as each batch develops.

- Confirm spawn, substrate ingredients, packaging, labels, cleaning products, and protective equipment before each cycle.
- Check supplier lead times and identify alternatives for critical inputs. Record supplier, product, lot or batch, and receipt date where relevant.
- Plan labour for filling, inoculation, room turnaround, harvest, and packing.
- Compare forecast with actual yield, quality, losses, and sales to improve the next schedule.
- Avoid overcommitting production; allow for crop variation, rejected product, and delivery changes.

6. Harvest, pack, and handle product carefully

Use clean, suitable tools and containers. Protect harvested mushrooms from dirt, damaged packaging, and unnecessary handling. Follow farm specifications for grading, cooling, storage, traceability, and dispatch. Link product identification to its batch and harvest date.

- Clean food-contact tools and surfaces with products suitable for that use.
- Separate damaged, decayed, or suspect mushrooms from saleable product and record their disposition.
- Use clean, labelled packaging and protect packed product during storage and transport.
- Follow validated farm requirements for post-harvest handling and customer orders.

7. Turn rooms around safely

After a crop cycle, remove spent substrate and debris using the designated route. Clean the room and equipment, then carry out the approved sanitation or post-crop treatment. Respect restricted access and re-entry instructions. Inspect and release the room before the next crop enters. If disease or pests occurred, the supervisor should decide whether additional controls or investigation are needed.

8. Use records to learn and improve

Records help trace batches, identify recurring problems, show that routines were followed, and plan labour and inputs. Keep entries legible and proportionate, on paper or digitally. Correct errors in a way that preserves the original entry and shows who made the change.

- Production plan and batch movement
- Spawn, substrate, and packaging inputs

- Room monitoring and deviations
- Cleaning, sanitation, and room release
- Pest sightings, contamination, crop loss, and corrective actions
- Harvest volume, grade, rejects, storage, and dispatch
- Staff training, equipment maintenance, and supplier issues

Daily management checklist

- ☐ Review task plan, staff roles, and room access
- ☐ Check and record required room conditions
- ☐ Inspect crops and report abnormalities promptly
- ☐ Use clean tools and follow the hygiene sequence
- ☐ Record batch movements, inputs, harvest, and waste
- ☐ Confirm cleaning is complete and signed off
- ☐ Hand over unresolved issues with assigned follow-up actions
